

## FACT SHEET

# EXTRA SWITCH WIRING

AUXSW-4 Hardwiring for four extra switches (from body builder electrical centre to instrument panel)

## Wire preparation kit for additional hardwired switches to support bodywork

The truck's electrical system is in many ways prepared to support bodywork applications, and Volvo also offers several wire preparation kits to meet different customer needs.

The kit includes the wiring from the allocated switch positions to the body builder electrical centre. The wiring supports up to four hardwired switches, both two position switches and three position switches. It can be used to control various body builder functionalities (e.g. tippers) and can easily be integrated with other wiring kits.

The switches are not included in this wiring preparation kit. For information about available switches, see the Volvo Body-builder Instructions (VBI) site.

## FEATURES AND BENEFITS

- Pre-routed wiring for superstructure connections shortens body builder lead times.
