

FACT SHEET

PNEUMATIC EQUIPMENT PROTECTION

PNPROT Protective cover for chassis-mounted pneumatic equipment

**Protection plates for pneumatic equipment**

PNPROT contains protection plates to protect the pneumatic system against falling objects. The cover plates enhance safety and improve durability. Depending on truck specification the following equipment will be protected with protection plates.

- The pneumatic centre can be mounted in three different locations: front, middle, and rear when positioned outside the frame. When mounted inside the frame, it does not require protection plates.
- Trailer brake valve mounted on the trailer arch.
- Brake test nipples are located at the rear end when the pneumatic centre is mounted inside the frame.

Additionally, when the pneumatic centre is mounted at the front, the deck plate over the battery box will be replaced with a unique deck plate adapted to the pneumatic centre protection plate.

**UPTIME**

- The protection plates enhance the overall truck performance, reliability, and durability.
